

Amendments to the Abstract:

Please amend the abstract in the above-identified patent application as follows:

An apparatus for a serial ventilation device that increases airflow compared to conventional devices without increasing the size is presented. The first ventilator is mounted on the intake opening side of the serial ventilation device, with the front surface of its blades facing the air intake side. The second ventilator is mounted on the exhaust opening side of the serial ventilation device, with the front surface of its blades facing the air exhaust side. Thus a first ventilator, which ventilates from ~~to~~ the rear side of the ~~blades~~ ventilator, and a second ventilator, which ventilates from ~~to~~ the front side of the ~~blades~~ ventilator, operate ~~when the ventilation side of the blades are facing the same direction and rotating in the same direction as a whole~~. Both ventilators are connected serially such that their rotation shafts are positioned ~~in the same straight line~~ coaxially, while the number of blades of the two ventilators are different.
